Memory Limit : $256\ MB$

Bivas received a colorful gift for his birthday. It is a string S of lowercase English letters. He is delighted and wants to brighten up his room using it.

He knows a set of colors C which consists of names of different colors. The set is fixed and showed below.

$C = \{$ "blue", "green", "yellow", "red", "purple", "orange", "pink", "grey", "cyan", "brown", "ash", "silver", "gold", "white", "black" $\}$.

Now he wishes to use some of the characters from S to make **different** colors and decorate his room on his special day. He wants to choose a subset of C such that all the colors from that subset can be made from using each character of S at most once. All the colors he wishes must be created simultaneously and he cannot use one instance of a character in creating different colors of the chosen subset. *Refer to the sample explanation for further clarity.*

You need to help Bivas find the maximum possible size of the desired subset.

Input Format

The first line contains an integer t denoting the number of test cases.

Then follow t lines each consisting of the string S for a test case.

Constraints

$1 \leq t \leq 20$

$1 \leq |S| \leq 10^5$

Output Format

For each testcase print the answer in a separate line.

Sample Input 0

```
3
bluehatesred
dergey
nothing
```

Sample Output 0

```
3
1
0
```

Explanation 0

- First testcase: You can make the colors "blue", "ash" and "red" together.
- Second testcase: You can either make "grey" or "red", but not both of them together.
